

Learning & Blocker Journal

Developer: Esther Wambui Kafuko

Date: August 18, 2026

Phase: Day 1-2 Solo Recon

Blocker Entry 1: The Scope Error

- **Date & Time:** August 17, 2026
- **The Goal:** Make the HTML button trigger my code when clicked.
- **The Error:** The computer threw an error saying `fetchInventory is not defined`. The HTML button couldn't find the JavaScript code because the code editor kept the two files completely separated.
- **Resources Consulted:** Read the MDN Web Docs about standard ways to link buttons and code.
- **The Resolution:** I stopped trying to link the button directly inside the HTML file. Instead, I went into the JavaScript file and wrote code that actively searches for the button and attaches the click event there.

Blocker Entry 2: The DOM Race Condition

- **Date & Time:** August 17, 2026
- **The Goal:** Connect the newly written JavaScript event to the HTML button.
- **The Error:** A silent failure. The button did absolutely nothing, and there were no error messages. The issue was that the JavaScript was running too fast—it tried to attach itself to the button before the webpage had even finished drawing the button on the screen.
- **Resources Consulted:** Researched how web browsers load pages and what a "race condition" is.
- **The Resolution:** I wrapped my JavaScript inside a `window.onload` command. This simply tells the code to pause and wait until the entire webpage is fully loaded before trying to connect to the button.

Blocker Entry 3: Environment Sandbox Limitations

- **Date & Time:** August 17, 2026
- **The Goal:** Test the finished code inside a mobile browser simulator.
- **The Error:** The testing platform's split-screen setup kept blocking my code. It kept aggressively separating the HTML and JavaScript, causing the same errors to happen even though my code was written perfectly.

ASSIGNMENT 1

- **Resources Consulted:** Looked into how to build a simple web app using just one single file.
- **The Resolution:** I completely abandoned the testing platform's split-screen editor. I took all of my JavaScript and pasted it directly inside the HTML file using a `<script>` tag. This bypassed the testing platform's artificial rules and made the prototype 100% functional.
